

Amateur Television (ATV)

real TV, not cellphone cam

Michael Wright, K6MFW

Real television! Same technology with different frequencies and applications

FCC Part 73 Broadcast: Entertainment, sports, advertisement, make money

FCC Part 97 Amateur: Experimentation, hobby, ARES/RACES, cannot make money

Save those old VHS VCR recorders!

Most are cable-ready and make excellent UHF ATV receivers. They have video outputs for monitors, recorders, and many have better sensitivity than TV sets.

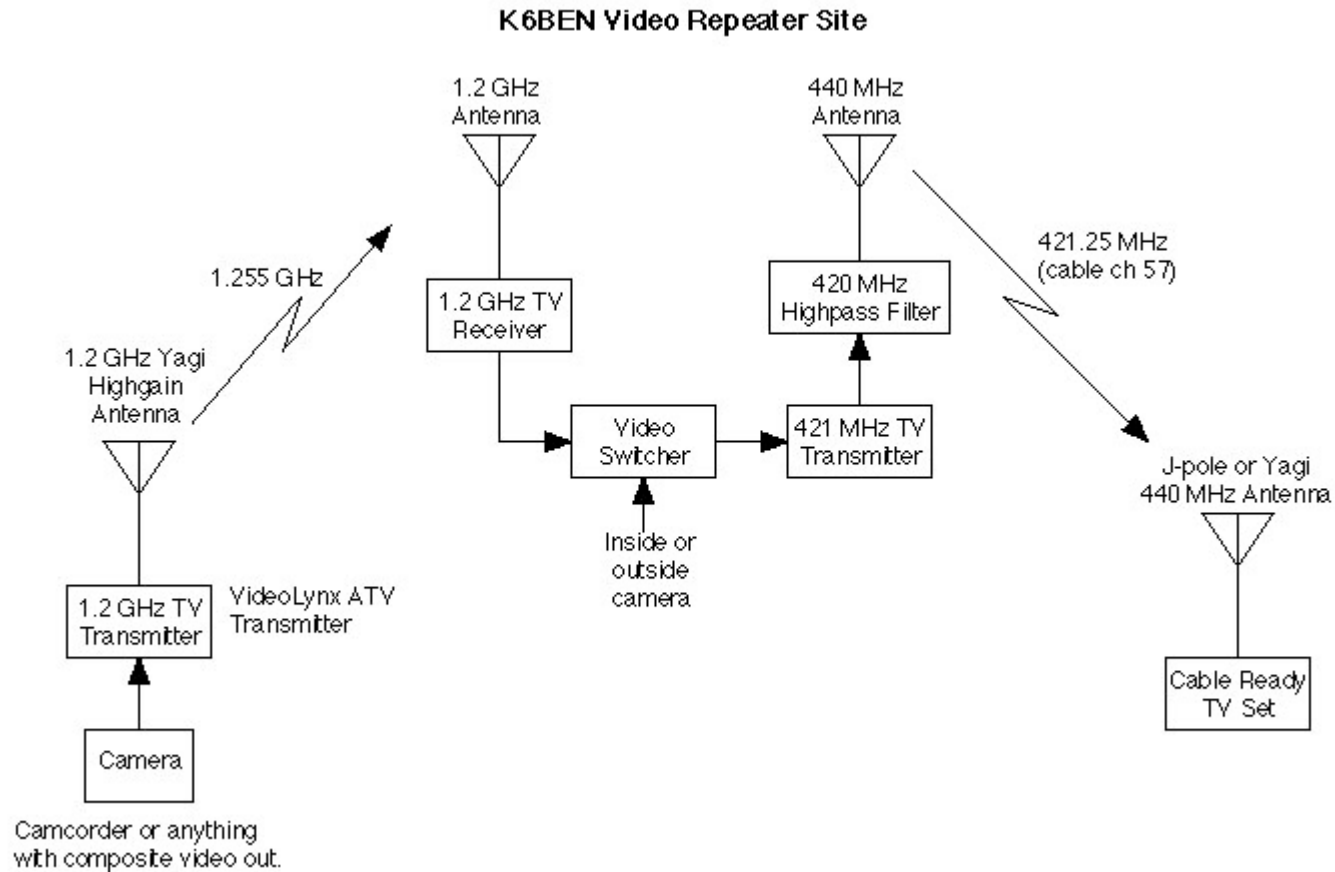

Why more CATV channels than broadcast TV channels?

- CATV uses frequencies of other radio services, as long as it stays inside the cable!
- These frequencies include amateur radio (i.e. cable channel 58 is 427.25MHz)
- Use “Part 73” receivers for view “Part 97” transmissions with external antenna

Digital TV. The Big Transition only applies to FCC Part 73 commercial broadcast.

Future of ATV regarding DTV transition? Not immediate but few years there will be an impact (in terms of usable equipment, lack of techie knowhow)

K6BEN: South Bay's Amateur Television Station

ATV in the Field

because that's where the action is

“Shack” transmissions are boring and useless for ARES/RACES

Transmitting from the field offers excitement, TV transmissions of your own creation, show off your technical prowess, and be like the media guys reporting live on the scene.

Only use 12VDC devices (transmitters, TVs, cameras).

For AC inverters, use smaller units i.e. 100 watts maximum.

Field kits should be simple enough for any reasonable amateur radio person to operate, and quick to setup or delegate tasks (someone to deploy cables, another to raise antenna, one to connect power sources, etc.).

Highly specialized systems prevents ability to delegate.

Balance of simple systems/limited ability or flexible systems/messy.

Think like media ENG people. Slow movements, framed on subject, etc.

ARES/RACES footage is boring, it is not entertainment, but there are serious viewers.

Batteries, batteries, batteries,... whether you use a cheap camcorder, state-of-art HDTV, or dear old dad's Betamax, you must have plenty of batteries to maintain operations.

ATV Transmitters

Three bands to consider:

UHF (70cm) to transmit directly to cable-ready TV sets (421, 427, 434, 439 MHz)

1.2GHz (23cm) to transmit to K6BEN repeater

2.4GHz (13cm) for point to point, compatible with Part 15 wireless video monitors

RF Transmission Cable... really important

- Use the highest of quality lowloss coax.
- Cheap cable WILL NOT work. Don't use RG-8, RG-58 except patch cables
- Recommended cable is Belden 9913, LMR400, Heliax.
- Lowloss cable is absolutely a must for 1.2GHz and 2.4GHz including receiver use

UHF Transmitters

RTX70-1 (1w crystal controlled), \$300 from PC Electronics, <http://www.hamtv.com>

VM-70X (5w 4-channel), \$200 from VideoLynx, <http://www.transmitvideo.com>

Z70A Mini (100mW 4-channel), \$150 from VideoLynx, <http://www.transmitvideo.com>

Video (CATV) modulators. These are VSB, not DSB as in “amateur TV” transmitters.

- Regular TV receivers are VSB, lower sideband not needed.
- Superior video quality, go with these and never use DSB ATV transmitters.
- Low power RF about 1/4watt, need linear amp for higher RF power

Excellent video modulator for sale at http://www.charleslidstone.com/for_sale/A2020/

- \$30 plus \$20 shipping
- Freq agile, 12VDC low current great for portable foot cam

R.L. Drake (www.rldrake.com) is a well known manufacturer of CATV modulators

Drake VM2551 Agile Commercial Video Modulator (\$600 new)

Drake VMM860AG Mini Video Modulator (a few hundred dollars new)

however many used modulators can be found on ebay

Linear amps must be class A type (do not want distortion) but verify amplifiers will work for television transmissions.

Downeast Microwave, <http://www.downeastmicrowave.com> (very long lead times)

Made specifically for ATV: UHF 7025PA (35W), \$210

Mirage Amplifiers, <http://www.mirageamp.com>

Specifically designed for amateur television: D-1010-ATVN (50W) \$440

1.2GHz Transmitters and Receivers

Warning! Verify 1.2GHz transmitters operate only on amateur radio frequencies.

 Never buy anything else, most likely operates on aero-navigation frequencies

 If company or dealer cannot say exact frequency, then illegal to operate

MobiComm Communications (Netherlands) on ebay, Seller ID: gnupic

Sales are via buy-it-now

DFM1200TSIM, 50mW 1.2GHz ATV transmitter, \$70

DFM1200TSIM1W 1watt 1.2GHz ATV transmitter, \$130

DFM1200RTIM 1.2GHz receiver, \$80 (needs preamp)

Linear amp from 1.2GHz Downeast Microwave 2330PATV (30W), \$240

Receiver preamp 1.2GHz Downeast Microwave 23LNAWPQ LNA \$120

verify will work for ATV (very long lead times)

1.2GHz systems from www.hamtvstore.com ATVQ magazine says it is a scam site.

Comtech 1.24 to 1.30 GHz Transmitters (\$70) and Receivers (\$70)

Transmitter power is 40mW, receiver may need de-emphasis circuit
available from <http://comtech.hampubs.com>

 *Never Purchase or Use 1.2GHz That Do NOT List Actual Transmit Frequencies*

There are plenty on ebay, sold on-line, sold at Pacificon, etc. These transmit 1000 to 1180MHz range, this is aeronautical navigation (transponders) so don't be a contributor to knocking an airplane off course.

2.4GHz (13cm) 2300-2310 MHz, 2390-2450 MHz
point to point, compatible with Part 15 wireless video monitors

DFM2350TSIMP-WB, 200mW transmitter, \$100 from Mobilcomm
DFM2400RTIM-B receiver, \$80 from Mobilcomm

X10, Swan wireless cameras at Fry's, baby monitors, etc.
These are 4-channel, only 2 operate on amateur radio frequencies.

Microwave ovens operate at 2.450GHz

2.4GHz is a crappy band...

Digital Television

(sorry no experience with this mode)

Most likely will never be Part 97 “amateur” gear (mpeg is a proprietary format)

Commercial products (maybe) from companies RL Drake, Vecima, Harris,...

DTV signal requires more power, uses “more” of spectrum as compared to analog NTSC
Analog NTSC uses 6 MHz spectrum but it’s AM carrier is relatively small slice
Digital transmission is a solid 2 MHz signal

Terrestrial and satellite use different modes.

NEW! NEW! NEW! NEW! NEW! NEW! NEW! NEW! NEW!

November 1, 2008 N6QQQ performed ATSC transmission on UHF ham band,
German DATV from (<http://www.sr-systems.de>) on 420-426 MHz with 1/10 milliwatt.

Nick does a tour of the ATSC transmitting gear at
<http://www.youtube.com/watch?v=q0ky-tUrveI>

“This is a capture of my ATSC ATV setup. This time, I am using the camera to give a tour of the equipment, including showing the transmitted signal on a spectrum analyzer.”

Cameras

Any camera with composite video output and 12VDC, no need to send sound

CCD cameras are typical, many on the used market. Avoid tubetype cameras.

Camera should be 12VDC with composite video output. If not 12VDC, it should be equipped with necessary inverter (but keep it small to maintain efficiency)

Camera with built-in titemaker and that is not “auto shut-off” a real plus

A recommended camera is Sony TRV-138, \$215 from B&H Photo or BestBuy

Antennas, Cables, ID Overlays

Antennas should be small for easy transport and setup, but “big” enough for RF gain.

3-element UHF yagi, \$40 from centerfireantenna.com

SVECS UHF J-pole, \$25 from HRO

Dualband VHF/UHF Elk antenna, \$90 from HRO

Comet 1216E 1.2GHz multiple element yagi, \$150 from HRO

Antenna tripod MFJ-1919, cost \$80 from HRO.

MFJ-1919 is superior to ChannelMaster tripods. Lightweight, no tools required, more stable, not as ugly, etc.

Use the highest quality coax, i.e. LMR400 or 9913F. Do not use RG-8 or RG58.

Intuitive Circuits onscreen displays: OSD-ID-SA \$120, OSD-ID-PC \$140, OSD232 \$100

<http://www.icircuits.com>

Jameco Electronics XBOB-NC video text module (part # 283768) \$190

<http://www.jameco.com>

ATV Receivers

Cable ready TV set that is direct tune, not autotune. Do not use “downconverters”

Ideal receiver is one with built-in VCR to record ARES/RACES events as needed. Avoid DVD recorders (not reliable)

Stores sell new TVs that are digital. Analog only no longer available including Icom R3.

Last year there were NO brand new small TV sets for sale, Best Buy, Circuit City are now beginning to stock with small lower cost TV sets.

roadtrucker.com has products to operate on 12VDC including cableready TV sets.

Local ATV Groups

Your first and fastest way to get into ATV is jump into a weekly net!

Silicon Valley ATV Group - K6BEN

<http://www.batnet.com/mfwright/k6ben.html>

http://k6ben_svatv.tripod.com/index.html (has sound file)

Input 1255 MHz video, output 421.25 MHz (cable ch 57) NTSC video
Voice input 145.510 Mhz simplex

K6BEN video weekly net, visitors welcome, every Weds at 8:30 pm
Can also check in audio on 145.510 MHz simplex or 443.125+, PL123.0

Mt. Diablo W6CX ATV (Contra Costa Co.)

<http://www.mdarc.org>

Input 1289.25 MHz video, output 910.25 and 1241.25
Can no longer use 427 MHz due to PAVE PAWS

W6CX video weekly net, Thurs at 8:00 pm, audio on 147.060+, PL100 MHz

Stanford Amateur Radio Club - W6YX

<http://www-w6yx.stanford.edu/w6yx/>

2433.75 MHz (X10 channel B)
